

## TT 10: Superconductivity: Fabrication and Characterization

Time: Monday 14:00–15:00

Location: H 3010

TT 10.1 Mon 14:00 H 3010

**MOCVD and MOD process for Coated Conductors** — ●OLIVER STADEL<sup>1</sup>, RUSLAN MUVDINOV<sup>1</sup>, JÜRGEN SCHMIDT<sup>4</sup>, HARTMUT KEUNE<sup>4</sup>, GEORG WAHL<sup>1</sup>, GÜNTER KOTZYBA<sup>2</sup>, ANITA WILL<sup>2</sup>, RAINER NAST<sup>2</sup>, ALEXANDRA JUNG<sup>2</sup>, WILFRIED GOLDACKER<sup>2</sup>, SERGEJ SAMOILENKOV<sup>3</sup>, OLEG GORBENKO<sup>3</sup>, and ANDREJ KAUL<sup>3</sup> — <sup>1</sup>TU Braunschweig, IOT, Bienroder Weg 53, 38108 Braunschweig — <sup>2</sup>Forschungszentrum Karlsruhe, ITP, Hermann von Helmholtz Platz 1, 76344 Eggenstein Leopoldshafen — <sup>3</sup>Moscow State University V234, Department of Chemistry, Moscow 119 899 — <sup>4</sup>PerCoTech AG, Bienroder Weg 53, 38176 Braunschweig

A MOCVD and a MOD process for continuous deposition of oxide buffer layers and YBCO at once on long metal tapes was developed. Textured Ni(W) tapes were coated with oxide buffer layers at low oxygen partial pressure without oxidation of the metal tape. YBCO films of 350-1000 nm thick were obtained using tape velocity of 4 m/h. MOCVD and MOD buffer layers, which were delivered from partners of the Virtual Institute, were covered by YBCO. Entirely obtained by MOCVD superconductive samples revealed a critical current density of 1MA/cm<sup>2</sup> at 77 K. The excellent in plane texture (FWHM = 5-6°) and out of plane texture (FWHM = 1.4-3°) of YBCO films may enable to increase the critical current density further. YBCO deposited on MOD obtained buffer layers reached the maximum critical current density 2MA/cm<sup>2</sup>.

Acknowledgement - The authors thank the partners of the Virtual Institute Chemically deposited YBCO Superconductors.

**Roebel Assembled Coated Conductor Cables (RACC): Ac-Losses and Application Potential** — ●CURT SCHMIDT and WILFRIED GOLDACKER — Forschungszentrum Karlsruhe, Institut für Technische Physik

High temperature superconducting (HTS) cables for transport currents well above 1 kA, assembled from a number of tapes, are required for application in transformers, generators and for future fusion reactor coils. Coated conductor (CC) tapes are suitable candidates for an operation temperature between 50 and 77 K which is a crucial precondition for economical cooling costs. Ac-field applications require low ac-loss cables and hence transposition of the individual tapes. The in the plane inflexibility of the tapes doesn't allow classical twisting techniques. The problem can be solved using a modified Roebel technique where meander shaped tapes are assembled to a Roebel cable. The electrical connection between the tapes, necessary to allow current redistribution, and the mechanical stability is achieved by impregnation with a conductive epoxy resin. We prepared short lengths of cables with 11 and 12 structured tapes and measured ac-losses in an external ac field and coupling current time constants. In the interesting frequency range below 100 Hz the coupling losses are small compared to hysteresis losses in the tape. The possibility of hysteresis loss reduction by striating the tapes should therefore be taken into consideration. Finally we discuss the potential of this cable type with respect to ac-losses and current carrying capability as a function of operation temperature, as well as possible routes of long length cable fabrication.

TT 10.3 Mon 14:30 H 3010

**Effect of rare earth and alkaline earth substitutions in the superconductor RuA<sub>2</sub>RECu<sub>2</sub>O<sub>8</sub> (RE=Gd, Eu, Nd, Pr; A=Ca, Sr, Ba): crystal structure and physical properties** — ●EUGENIO CASINI<sup>1,4</sup>, CONSIGLIA TEDESCO<sup>2</sup>, ANTONIO VECCHIONE<sup>2</sup>, THOMAS P. PAPAGEORGIOU<sup>3</sup>, HANS F. BRAUN<sup>4</sup>, MANUEL KEMPF<sup>4</sup>, and JOHANNES KRÄMER<sup>4</sup> — <sup>1</sup>PANalytical, Almelo, The Netherlands — <sup>2</sup>Università di Salerno, Italy — <sup>3</sup>Forschungszentrum Dresden-Rossendorf, Germany — <sup>4</sup>Universität Bayreuth, Germany

For small rare earth ions (RE=Gd, Eu), single phase compounds are obtained with the typical ordered layered structure and no significant changes of physical properties. With large rare earth ions (RE=Nd, Pr), polyphase samples were obtained and the phases in equilibrium at the nominal composition RuSr<sub>2</sub>RECu<sub>2</sub>O<sub>8</sub> were determined. In these cases, no ordered layered structure was observed. The disorder between Ru/Cu or Sr/RE is presumably due to the similar Ru/Cu and Sr/RE ionic sizes. Magnetization studies of these compounds are discussed.

The effect of substituting Sr<sup>+2</sup> with the smaller Ca<sup>+2</sup> and larger Ba<sup>+2</sup> is examined. The substitution with Ca<sup>+2</sup> results in a complex mixture. We cannot confirm the previously reported formation of the layered RuCa<sub>2</sub>NdCu<sub>2</sub>O<sub>8</sub>. For Ba<sup>+2</sup> substitution, a binary mixture Ba<sub>2</sub>RuNdO<sub>6</sub>-CuO is obtained. A different number and different types of phases in equilibrium are found with different alkaline earths (A=Ca, Sr, Ba) at the nominal RuA<sub>2</sub>NdCu<sub>2</sub>O<sub>8</sub> composition. The variation in the mismatch of the A/Nd (A=Ca, Sr, Ba) size does not lead to the formation of an ordered layered RuA<sub>2</sub>NdCu<sub>2</sub>O<sub>8</sub> compound.

TT 10.4 Mon 14:45 H 3010

**Growth and study of LuNi<sub>2</sub>B<sub>2</sub>C single crystals** — ●ANKE KÖHLER<sup>1</sup>, GÜNTER BEHR<sup>1</sup>, BEATE BERGK<sup>2</sup>, GÜNTER FUCHS<sup>1</sup>, KONSTANTIN NENKOV<sup>1</sup>, and JOACHIM WOSNITZA<sup>2</sup> — <sup>1</sup>IFW Dresden, D-1171 Dresden — <sup>2</sup>Forschungszentrum Dresden-Rossendorf, D-01328 Dresden

Rare earth-nickel-borocarbides have attracted much interest in the last years because the compounds show the interplay of superconductivity and magnetic ordering. LuNi<sub>2</sub>B<sub>2</sub>C can be considered as non-magnetic reference system of such magnetic borocarbides as HoNi<sub>2</sub>B<sub>2</sub>C in which superconducting and antiferromagnetic ordering temperatures, T<sub>c</sub> and T<sub>N</sub>, are similar.

So far, LuNi<sub>2</sub>B<sub>2</sub>C crystals were only prepared by a flux method. For growing larger crystals we used an optical floating zone (FZ) technique, which already was successful in crystal growth of other RNi<sub>2</sub>B<sub>2</sub>C (R = Y, Tb, Ho, Tm, Er) compounds. In the case of LuNi<sub>2</sub>B<sub>2</sub>C, the primary crystallization field is far from the stoichiometric composition, and adjacent to the peritectic LuB<sub>2</sub>C<sub>2</sub> phase field an extended region of LuNiBC occurs. Systematic studies of polycrystalline samples revealed that samples with nominal compositions LuNi<sub>5</sub>B<sub>3.5</sub>C and LuNi<sub>5</sub>B<sub>3</sub>C<sub>0.5</sub> are free of the peritectic LuB<sub>2</sub>C<sub>2</sub> and LuNiBC phases. Thus in the FZ crystal growth experiments we used a molten zone which corresponds to these compositions.

From the grown LuNi<sub>2</sub>B<sub>2</sub>C rods single crystalline pieces have been prepared to investigate Fermi surface peculiarities by magneto-resistance measurements and to study the electronic band structure.

## TT 11: Superconductivity: Tunneling, Josephson Junctions, SQUIDS

Time: Monday 15:15–18:00

Location: H 3010

## Invited Talk

TT 11.1 Mon 15:15 H 3010

**Superconducting Quantum Interference Filters** — ●NILS SCHOPOHL — Institut für Theoretische Physik der Universität Tübingen

Basic principles of Josephson junction based interferometer arrays are reviewed. Key features of parallel and also serial Superconducting Quantum Interference Filters (SQIFs) are explained in detail. It is shown that SQIF interferometers can be engineered to have a specific voltage output pattern vs. magnetic field that is well suited for applications in magnetometry and also microwave sensorics.

TT 11.2 Mon 15:45 H 3010

**Tailored Josephson phase: 0,  $\pi$  and  $0-\pi$  SIFS Josephson junctions** — ●MARTIN WEIDES<sup>1</sup>, ALEXEY BANNYKH<sup>1</sup>, UTHAYASANKARAN PERALAGU<sup>1</sup>, JUDITH PFEIFFER<sup>2</sup>, MATTHIAS KEMMLER<sup>2</sup>, DIETER KOELLE<sup>2</sup>, REINHOLD KLEINER<sup>2</sup>, and EDWARD GOLDOBIN<sup>2</sup> — <sup>1</sup>Institute for Solid State Research, Research Centre Jülich — <sup>2</sup>Physikalisches Institut - Experimentalphysik II,

In superconducting/ferromagnet (S/F) systems the superconducting wave function extends into the ferromagnet with a damped oscillatory behavior. This results in novel and interesting physics, such as the possibility to realize a  $\pi$  Josephson junction (JJ) — a JJ with the phase drop of  $\pi$  in the ground state. Recently, we fabricated Nb/Al<sub>2</sub>O<sub>3</sub>/NiCu/Nb JJs with uniform as well as step-like ferromag-
